

Green Skilling

Building a Sustainable Future Through Skills

Presented by: Umang Parmar

Enrollment No: 240840131089

Stream: CSE

College: RNGPIT

What is Green Skilling?

Green Skilling means learning the knowledge, values and abilities needed to live, work and do business in an environmentally sustainable way. It prepares people to support eco-friendly practices across industries such as energy, agriculture, construction and technology.

Key Points

- Awareness of environmental issues
- Skills for renewable energy & clean tech
- Practices that reduce waste & pollution
- Preparing youth for green jobs

Sustainability

Sustainability means meeting the needs of the present without compromising the ability of future generations to meet their own needs. It rests on three connected pillars:

Environmental

Protecting natural resources, air, water & biodiversity

Social

Ensuring equity, health and quality of life for people

Economic

Supporting growth without depleting resources

Green Skilling Activities

1

Tree plantation & campus greening drives

2

Waste segregation & recycling awareness

3

Energy audits and use of solar/renewable devices

4

Workshops on eco-friendly practices

5

Water conservation and rainwater harvesting

6

Promoting e-waste responsible disposal

Current Sustainability Projects

Renewable Energy Expansion

Growth of solar & wind power installations to cut fossil fuel dependence

Smart Waste Management

IoT-enabled bins and recycling systems in cities

Green Building Initiatives

Energy-efficient, eco-certified construction projects

Sustainable Agriculture

Organic farming and water-efficient irrigation programs

Pros and Cons of AI in Sustainability

Pros

- + Optimizes energy use & reduces waste
- + Predicts climate patterns accurately
- + Improves resource management
- + Speeds up sustainable innovation

Cons

- High energy use of AI data centers
- Costly to implement and maintain
- Risk of job displacement
- Requires large, reliable data sets

Capstone Project

Project Idea

Design and develop a small AI-based application that helps track and reduce household or campus energy/water consumption, giving users simple tips to build sustainable habits.

- 1 Identify a real sustainability problem to solve
- 2 Collect relevant data (energy, waste, water usage)
- 3 Build a simple, functional prototype/tool
- 4 Test, evaluate impact and present findings
